REMARKS/ARGUMENTS

In the specification, several sections were added per the examiners request. These sections were originally left out as the electronic filing applications that were used at the time, ePave 5.1 and PASAT, did not require them, and the application passed the validation process when preparing it for electronic submission. While most sections were not applicable to the current invention, the Background of the Invention and the Short Summary sections added significantly to the application.

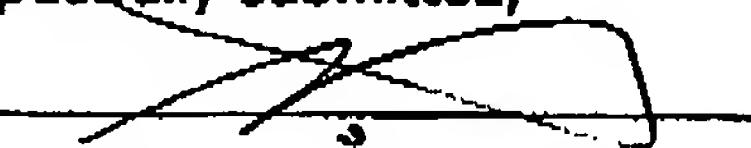

In the specification, the paragraphs [Para 1] - [Para 8] and [Para 11] - [Para 18] have been amended to correct minor editorial problems.

Claims 1-2 were amended after reviewing previous art as provided by the examiner, specifically U.S. Pat. No. 3,324,849 (Harvey Kravitz) and U.S. Pat. No. 6,079,423 (Suzuki, Akio). The intent of the amendments is to provide clarification of the differences between the present invention and the claims made in the previous art.

While preparing the amendments to the original application, the electronic filing programs provided by the USPTO were used, namely ePave 5.2 and ABX 1.2.1. Some differences in appearance from a manual approach to formatting the application for submission may be due to the standards enforced by the USPTO programs, which appear to be different in some respects from what is represented in existing published patent applications. For example, the way paragraphs and claims are numbered within the documents for example is different. Where these differences were apparent, the standards enforced by the USPTO programs were used.

Applicant respectfully requests that a timely Notice of Allowance be issued in this case.

Respectfully submitted,

By 

Lonnie King

BACKGROUND OF THE INVENTION**3. Field of the Invention**

The present invention relates to a new approach to the standard swab, which is typically used for cleaning a user's skin and applying topical treatments such as medications or makeup to a user's skin.

4. Description of the Related Art

The traditional swab is comprised of 2 primary components: a body frame, typically a stick fashioned from either paper, plastic or wood, and an applicator, typically an absorbent material such as cotton, foam rubber or other synthetic material, attached at one or both ends of the body frame.

One issue with the traditional swab design relates to the potential danger of damage to the eardrum when swabs are improperly used to clean the outer ear, as referenced in U.S. Pat. No. 5,127,899 (Schmerse, Jr.).

Amdt. Dated Nov. 18, 2005

Reply to Office Action of Sept. 6, 2005

A second area of concern regarding traditional designs centers on product manufacturing costs, which can be high due to the requirement of rather complex and expensive machinery and manufacturing techniques, as referenced by U.S. Patent No. 6,080,126 (Zygmont, et al.). The goal of present invention is to provide an improvement over traditional cotton swabs in terms of safety and versatility, and to suggest a solution to the above stated issues while maintaining a similar cost of manufacture in relation to more conventional swabs.

BRIEF SUMMARY OF THE INVENTION

In order to solve the foregoing problems, according to a first aspect of the present invention, the body frame width is double that of the round sticks used by traditional swabs, providing the amount of body frame width necessary to create an offset length to which the applicator can be affixed.

In order to solve the foregoing problems, according to a second aspect of the present invention, an offset between the distance of the rearward and forward portions of the applicator area is created by a square cutout at each end of the body frame, resulting in an extended portion of the swab which prevents the swab from intruding beyond a safe distance into the ear canal, providing superior drying or cleaning of this portion of the ear.

In order to solve the foregoing problems, according to a third aspect of the present invention, a simplified approach to body frame construction is described wherein:

lengths of inexpensive plastic sticks are cut down to a prescribed length by a standard conveyor system, or

rolls of inexpensive plastic material are cut down to a prescribed length by a standard conveyor system, and

a specialized offset metal blade is defined to cut a plastic stick or roll at a prescribed distance along its length to create the swab's body frame.

DESCRIPTION

Brief Description of Drawings

[Para 1] FIGURE 1 shows the completed swab.

[Para 2] FIGURE 2 is a cross section view showing the relative position of the absorbent materials at each end of the body frame to the body frame itself.

[Para 3] FIGURE 3 shows an end view of the cut body frame evidencing the rounded edges and relative thickness of the body frame material.

[Para 4] FIGURE 4 provides a top view of the body frame lying flat on its widest aspect. It also shows the offset created by the single cutout at lengths along the plastic strip.

[Para 5] FIGURE 5 provides a detailed view of the cutting process and the resultant offset created by the single cutout at lengths along the plastic strip.

[Para 6] FIGURE 6 shows the shape of the cutting blade used to separate the plastic strip into individual swab body frames.

Detailed Description of the Invention

[Para 7] The traditional swab is comprised of 2 primary components: a body frame, typically a stick fashioned from either paper, plastic or wood, and an applicator, typically an absorbent material such as cotton, foam rubber or other synthetic material, attached at one or both ends of the body frame. Generally, the applicator material is attached to the body frame with a small amount of adhesive. The intention of the applicator pads is to absorb fluids, clean wounds and other areas, as well as being used as an applicator for medicines, cosmetics and the like. In this regard, the invention described herein is similar to other traditional swabs.

[Para 8] A well-known issue with the traditional swab design relates to the potential danger of damage to the eardrum when swabs are improperly used to clean the outer ear, as referenced in U.S. Pat. No. 5,127,899 (Schmerse, Jr.).

[Para 9] The goal of this instrument is to provide a major improvement over traditional cotton swabs in terms of safety and versatility, and suggest a solution to the above stated issue while maintaining a similar cost of manufacture in relation to more conventional swabs.

[Para 10] Unlike the traditional round single length swab, this device can allow deeper and safer access to areas such the outer ear and opening to the ear canal while greatly reducing or even eliminating the possibility of accidental damage from misapplication of the swab.

[Para 11] FIGURES 1 through 5 illustrate that this is accomplished by two significant design improvements: the doubling of the body frame **11** width over the round sticks used by traditional swabs, and the inclusion of an offset **12a** and **12b** distance between the rearward and forward portions of the applicator area **10** created by a cutout **13** at each end of the body frame. This prevents the extended portion of the swab from intruding beyond a safe distance into the ear canal, providing superior drying or cleaning of this portion of the ear. FIGURE 3 shows an end view of the cut body frame evidencing the rounded edges and relative thickness of the body frame material. The wider and sturdier design allows for use of the swab in situations where either a standard size swab will not work, or a single swab will not suffice.

[Para 12] A second area of concern regarding traditional designs centers on product and manufacturing costs. While this is a reasonable concern, it is a secondary goal for this design behind providing a safer product than conventional swabs. However, even though this design requires using somewhat more material than a standard swab, the cost of the manufacturing process for this instrument should be comparable to traditional paper based stick designs, which can require rather complex and expensive machinery and manufacturing techniques, as referenced by U.S. Patent No. 6,080,126 (Zygmont, et al.).

[Para 13] FIGURE 5 shows how the body frame for this device can be manufactured by inserting a length of flat pre-formed plastic strip with rounded edges into a cutting machine using a shaped cutting blade **13**.

[Para 14] FIGURE 6 shows the how the cutting machine stamp-cuts the single cutout **13** along pre-determined and consistent distances along the length of the pre-formed plastic strip creating the offset **12a** and **12b**. This process results in consistent fixed length body frames with practically no waste from the manufacturing process itself. The length of original material could be either in long sticks or from a roll. This material could be either solid or hollow bodied to meet the needs of specific application requirements.

[Para 15] The body frames **11** are then moved down the production line where one of two options can be followed:
